/note="0rgan: ovary; Vector: pBluescript II KS(+); Site_1:
Constructed from 1 million independent clones. cDnA
synthesis was initiated using an oligo(dT) primer, using
methylated C in the first strand synthesis reaction.
Following this first strand reaction, double-stranded cDNA
was blunted, ligated to Not! adapters, digested with
EcoRI, size-selected, and cloned into the Not! and ECORI
compartible sites of a custom modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
rounds using conditions adapted from Soares et al., PNAS
(1994) 91: 9228-9212 and Bonaldo et al., Genome Research 6
(1996): 791, except that a significantly longer
reannealing hybridization was used."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         US-09-023-655-1386
US-09-023-655-1386
Sequence 1386, Application US/09023655
Patent No. 6607379
GENERAL INFORMATION:
APPLICANT: Cocks, Benjamin G.
APPLICANT: Susan G. Stuart
APPLICANT: Office of Sequence
TITLE OF INVENTION: EXPRESSION
NUMBER OF SEQUENCES: 1508
CORRESSED: INVENTE BHARMACHUICALS, INC.
STREET: 3174 PORTER DRIVE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                US-09-757-415A-1_COPY_11_140 (1-130) x US-09-621-976-12526 (1-415)
                              GENERAL INCORPATION:
APPLICANT: Dumas Milne Edwards, J.B.
APPLICANT: Johnert, S.
APPLICANT: Glordano, J.Y.
ITLE OF INVENTION: ESTS and Encoded Human Proteins.
FILE REFERENCE: GENERT, 0.54 PR.
CURRENT APPLICATION NUMBER: US/09/621,976
CURRENT FILING DATE: 2000-07-21
NUMBER OF SEQ ID NOS: 19335

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    feature
                                                                                                                                                                                              GENERAL INFORMATION:

APPLICANT: Bull et al.

APPLICANT: Bull et al.

APPLICANT: Bull et al.

Patent No. 6503729

TITLE OF INVENTION: Complete Genome Sequence of the Methanogenic Archaeon, Methanococ TITLE OF INVENTION: jannaschii
FILE REPERRNCE: P8275

CURRENT APPLICATION NUMBER: US/08/916,421B

CURRENT FILING DATE: 1997-08-22

PRIOR PILING DATE: 1996-08-22
                                                            2013 CCCACGAGCGGCAAGCAGCTAGACCTGCTCTCCGGTGACACTTACCCCAAGGACT 2069

Zhou M;

WPI; 2001-425868/45.

New isolated nucleic acid sequences encoding polypeptides useful in structure based rational drug design.

Claim 11; Page 44; 235pp; English.

The sequence represents the amino acid sequence of mouse fibroblast growth factor receptor-1 (FGFR1)-derived peptide. The invention provides fragments of suc-1-associated neurotrophic factor target protein (SNT) and fibroblast growth factor receptor (FGFR) which can form a binding complex that is amenable to structural determinations by nuclear magnetic resonance (NMR) spectroscopy. The invention provides methodology for related structure based rational drug design using the three-dimensional data. The invention fulfills the need for the determination of the three-dimensional structure of such complexes as described and for procedures for related structural base drug design predicated on such structural

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention discloses isolated human nucleic acid alternative splicing variants that are all tumour-involved genes (TIGS). The nucleic acids and CV variants that are all tumour-involved genes (TIGS). The nucleic acids and CV polypeptides are useful for determining the level of a nucleic acid or polypeptide sequence in a biological sample, for determining the level of variant nucleic acid or polypeptide sequences in a biological sample and for determining the ratio between the level of variant sequence in a first biological sample and the level of the original sequence from which composition comprising a carrier and the nucleic acid, is useful for composition comprising a carrier and the nucleic acid, is useful for treating diseases (e.g. cancer) that can be ameliorated or cured by increasing or decreasing the level of the encoded protein. The nucleic acids are also useful for diagnostic purposes, especially for detecting cancer or a precisposition to cancer, for evaluating the state or aggressiveness of cancer disease, in basic research, for understanding the physiological function of the original TIG, in targeting or developing pharmaceuticals, for distinguishing various stages in the life
                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel nucleic acid sequence, which is an alternative splicing variant of tumor involved genes, useful for detecting cancer, predisposition to cancer, for evaluating cancer state and in gene therapy for treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence was deduced from a cDNA clone isolated from a library prepd. from mRNA from chicken embryos (day 6). It encodes a basic fibroblast growth factor receptor which can be used for tissue repair or developement and for neuron maintainance. The DNA and protein and antibodies prepd. from it can be used to treat diseases resulting from aberrant FGF expression and for elucidating the mechanism of FGF and identifying agonists for the prevention of angiogenesis and control of tumours. See also AAR10648. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 24-OCT-2003 to standardise OS field)
oycle of the same type of cells which may be helpful for the development of pharmaceuticals for various cancer stages in which cell cycle is non-normal, for determining mutations in tumour-involved genes and in gene therapy. The polypeptides are useful for identifying compounds capable of binding to the variant product and modulating its activity and for modulating endochelial differentiation and proliferation, as well as to modulate apoptosis either ex vivo or in vivo. The sequences presented in ABG796700-ABG79705 are the new variants (NV) 1-16 proteins of the TIGs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fibroblast growth factor receptors - and clones encoding them, sol. for feceptors and antibodies to them useful for diagnostic studies and

Polymucleotide sequences AAF17982 - AAF18424 encode human lung cancer associated proteins represented in AABS8106 - AABS8548. Lung cancer associated proteins and polymucleotide sequences, their agonists, and cartering and polymucleotide sequences, their agonists, and general included in the confidential cartiological; cardioactive; and munomodulatory; muscular active general; vilnerary; gastrointestinal cereivity. The invention also includes antibodies specific for the protein atoinculates antibodies specific for the protein or polymucleotide sequences. The lung cancer associated polymucleotide sequences may be used for detection of lung cancer, chromosome content and proteins may be used to treat disorders such as cereiovascular, reproductive, astrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders. The proteins may also be used in the treatment of wounds and infectious diseases.

Company of the polymucleotide and protein and peptide AABS549 are used in the course of the invention for the identification and characterisation of the polymucleotide and protein sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention covers both the full-length FGF-receptor and its soluble form (i.e. truncated by deletion of the C-terminal portion beginning at the transmembrane domain). The FGF receptor is defined as having the sequence in Columns 13-18 and Fig 2. These sequences differ slightly as indicated by the "Misc difference" in the Features Table. The receptor can be used to detect FGF or to inhibit FGF activity. Specifically, the soluble form of the receptor can inhibit FGF-dependent tumour growth, anglogenesis, psoriasis, excessive scar formation and hyperplasias and can be used to treat Herpes Simplex virus infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New recombinant human fibroblast growth factor receptor - is useful in treatment of hyperplasia(s), tumours and herpes simplex infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

```
The present sequence represents human fibroblast growth factor receptor 1 (FGFR1), which is encoded by a gene on human chromosome 8. A newly can dentified oncogene, STRT98 FCFR1 (see AAX80177), incorporates a FGFR1 tyrosine kinase domain fused through t (8,13) translocation to ZNF198, a cover zinc finger protein (see AAY66457) and is associated with stem cell conceptual and the encoded oncoprotein (see AAY66456) provides the ability conceptual and the encoded oncoprotein (see AAY66456) provides the ability conceptual and the encoded oncoprotein (see AAY66456) provides the ability conceptual conceptual states and propes capable of hybridizing to ZNF198 or FGFR1 tyrosine kinase and probes capable of hybridizing to ZNF198 or FGFR1 tyrosine kinase domain coding sequences. Cells containing ZNR198 FGFR1 can be located using a radiolabeled antibody that recognizes the fusion juncture locus.

Antibodies that recognize this fusion juncture can also be used to deliver toxic substances to patients containing the ZNF198 FGFR1 protein.
                                                                                              ZNF198-FGFR1; fibroblast growth factor receptor 1; oncogene; lymphoma; leukaemia; SCLL; translocation; stem cell; diagnosis; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oncogene, designated ZNP198-FGFR1, useful in diagnosis of stem cell leukemia and lymphoma syndrome.
                                                                                                                                                                                     426. .427

This protein is used in a method which assays the ability of a substance to bind to a high-affinity heparin-binding growth factor (HBGF) receptor. The assay screens for potential anti-umour agents that inhibit binding of HBGF to high-affinity receptors, or for potential wound healing agents that promote such binding. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Assays for high-affinity heparin-binding growth factor receptor ligands using receptor-overexpressing cells or cell-free system.

The sequence was deduced from the cDNA sequence obtd. from two overlapping clones, PL5 and PL10, isolated from a placental lambda gtll cDNA library. The DNA can be used to express recombinant bRGF receptor which is an antagonist of human aRFGF and bRGF. The receptor can be used to treat abnormal anglogenesis (e.g. in diabetic retinopathy, neovascular glaucoma, etc., and possibly certain solid tumours), and in contraceptives. Dosage is 10-100 ug. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                               Extracellular form of human fibroblast growth factor receptor treat tumours, abnormal angiogenesis e.g. diabetic retinopathy, rheumatoid arthritis and arteriosclerosis and as contraceptives
                                                                                                                                   Sarmientos
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 822;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a human fibroblast growth factor receptor (FGFR). FGFR is useful for detecting FGF in a sample, and for inhibiting the activity of FGF. The FGFR may also be used to screen and identify compounds which mimic FGF binding: FGFR can be used to identify agonists and antagonists. The agonists identified may be used to accelerate wound healing, and the antagonists identified can be used to inhibit the growth of FGF-related malignancies
                                                                                                                                                                                                                                                                                                                                                                                    Novel fragment of a human fibroblast growth factor receptor, used to detect fibroblast growth factor in samples and to identify modulators of the factor, which are used to accelerate wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The sequence given encoded by the N-sam tumour gene. This protein could be the receptor of human bFGF. The N-sam protein and peptide fragments of N-sam are useful as anti-tumour drugs. Anti-N-sam peptide antibodies are useful for the detection of the N-sam gene product, in the purification of the N-sam gene product and in the diagnosis of tumours and anti-tumour

The invention provides fragments of sucressociated neurotrophic factor target protein (SNT) and fibroblast growth factor receptor (FGFR) which can form a binding complex that is smenable to structural determinations by nuclear magnetic resonance (NMR) spectroscopy. The invention provides methodology for related structure based rational drug design using the three-dimensional data. The dimensional structure of such complexes as described and for procedures for related structure can be seen to such structure of such complexes as described and for procedures for related structural base drug design predicated on such structural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Suc-1-associated neurotrophic factor target protein; SNT-1; protein co-ordinate data; mouse; fibroblast growth factor receptor; FGFR; nuclear magnetic resonance; NMR spectroscopy; rational drug design; three-dimensional structure.

New pyridylpyrimidine derivatives useful in the treatment or prevention of infectious disease e.g. Kuru syndrome and Creutzfeld-Jacob disease

Disclosure; Page 63-65; 96pp; English.

The invention relates to novel pyridylpyrimidine derivatives and methods of detecting prion infections and/or prion disease in an individual or in cells, cell cultures and/or cell lysates. The method involves adding at least one monoclonal or polyclonal antibody, oligonucleotide or pyridylpyrimidine derivative to the sample or in cells, cell cultures and/or cell lysates and detecting the activity of at least one human cellular protein kinases (e.g., FGF-R1 (also known as flg, Fl-1, Flt-2, b-FGFR), Tkt (also known as c-abl), clk1, MKY7 (also known as SARKIa, SARKIaha), CDC2 (also known as CDKI), PRK), human cellular protein phosphatases such as FTP-SL (also known as MCPB3) and PTP-seta, the cellular signal transduction molecules HSPB0 and GPIR-1. The invention is useful for regulating the production of prions in cells and in the manufacture of pharmaceutical composition for prophylaxis and/or treatment of infectious disease (e.g. Scrapie, chronic wasting disease (CWD), transmissible mink encephalopathy (TWE), Creutzfeldt-Jacob disease (CWD), bovine spongiform encephalopathy (BSE), variant CJD, Gersmann-Straussler-Scheinker syndrome (GSS), fatal familial insomnia (FRI), Kuru and Alpers syndrome, especially BSE, CJD, vCJD) or neurodegenerative diseases (e.g., Alzheimer's disease) in humans or ruminants. The present sequence is human FGF-RI protein used in the

A;Title: Purification and complementary DNA cloning of a receptor for basic fibroblast A;Reference number: A41345; WID:89298406; PMID:2544996
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A Accession: A41345
A Astaus: nucleic acid sequence not shown; not compared with conceptual translation
A, Molecule type: mRNA
A, Residues: 1-819 - LLEE>
A, Note: part of the sequence was confirmed by protein sequencing
                                                                                                                                                                                                                                                                             Cispecies: Xenopus laevis (African clawed frog)

A36477

Nibroblast growth factor receptor A2 precursor - African clawed frog

Nicontains: fibroblast growth factor receptor A2, short splice form; protein-tyrosine ki

C;Species: Xenopus laevis (African clawed frog)

C;Abecies: OB-Mar-1991 #sequence_revision 19-Jan-1996 #text_change 16-Jul-1999

C;Accession: A36477; C39752
